

ABSTRACT

A latch is disclosed that can be applied to doors in a variety of orientations and/or with keepers in a variety of orientations without any modifications to the latch being necessary. The latch includes a first module that carries a handle and an actuating member, and the latch
5 includes a second module that includes a latching mechanism. The first and second modules can be secured together with the first and second modules being relatively oriented in any one of a plurality of orientations, while the latch remains operational with the two modules secured together in any of the various orientations.
